Software errors are inevitable. Chaos is not.

Your users aren’t QA. Sentry’s cloud-based error monitoring helps software teams discover, triage, and prioritize errors, so you can find your bugs before they do.

Sentry by the numbers

- **42 billion errors** processed each month with Sentry
- **50,000+ teams** depend on Sentry
- **1 million+ developers** debug with Sentry

Why Sentry?

Report errors before they become your customers’ problems.

Sentry supports all commonly-used frameworks, and installation is quick and easy. Filter signal from noise to identify the problem-causers in your code with details on the frequency, client, release, and impact of any given issue. And unlike our competitors (who we obviously respect and admire), we’ll help you pinpoint the troublesome commit.

Seamlessly integrate with your workflow.

We’ve made it as painless as possible to integrate Sentry into your existing workflow. Create tickets in Jira, escalate errors though PagerDuty, and identify root causes in GitHub or Bitbucket. Because we know you have better things to do than string services together.

About Sentry

Sentry is a venture-backed, market-leading error monitoring solution. Those are a bunch of buzzwords meaning that we make software better, and people like what we’re doing. Basically, we let you configure alerts (so you don’t get bogged down with notifications you couldn’t care less about), pinpoint problematic commits (and the engineer best suited to fix it), and easily resolve errors.

People like us.

(Companies like us too.)

“Sentry is a game-changer. We use it not only to alert us of errors in our production app, but also issues in our command-line tools and builds. Logs are for auditing. Sentry is for real-time automation. Be kind to yourself and use Sentry!”

– Dan LaMotte, Sr. Principal Software Engineer, Symantec

When it comes to enterprise, we check all the boxes.
